

Species composition of total coral cover over time

Total cover trajectory per plot

Dark line = LMM trend | Band = 95% CI

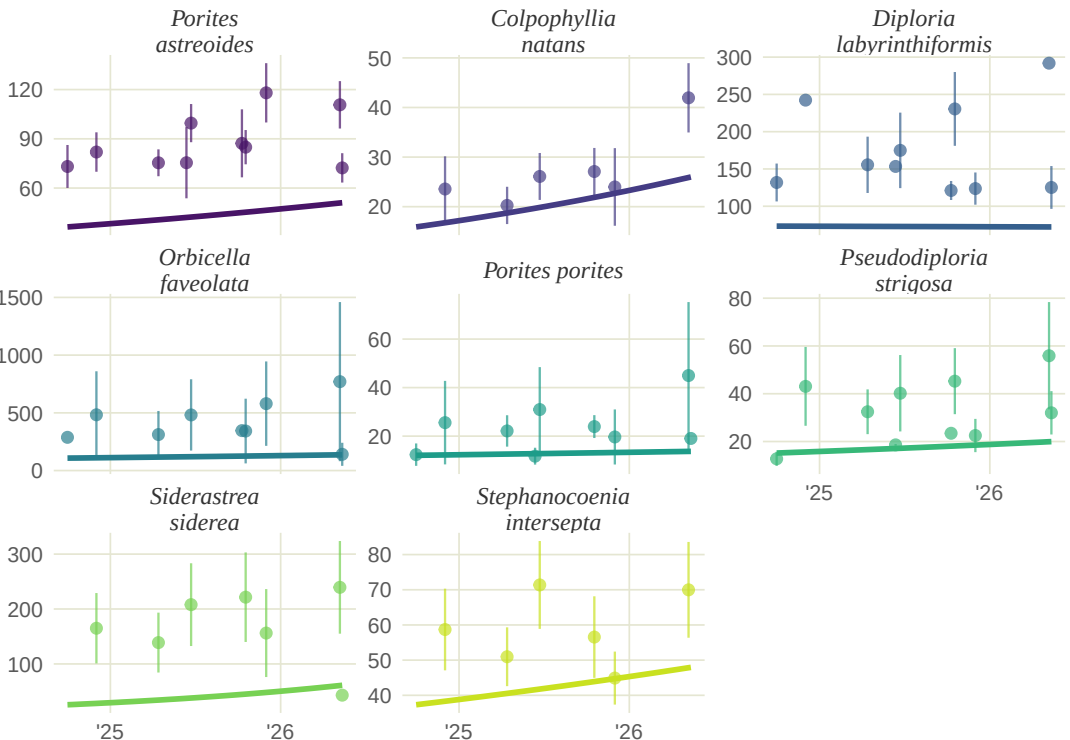

Residuals vs Fitted**Normal Q-Q – residuals****Scale–Location****Q-Q: random effects (colony)**

Species growth trajectories

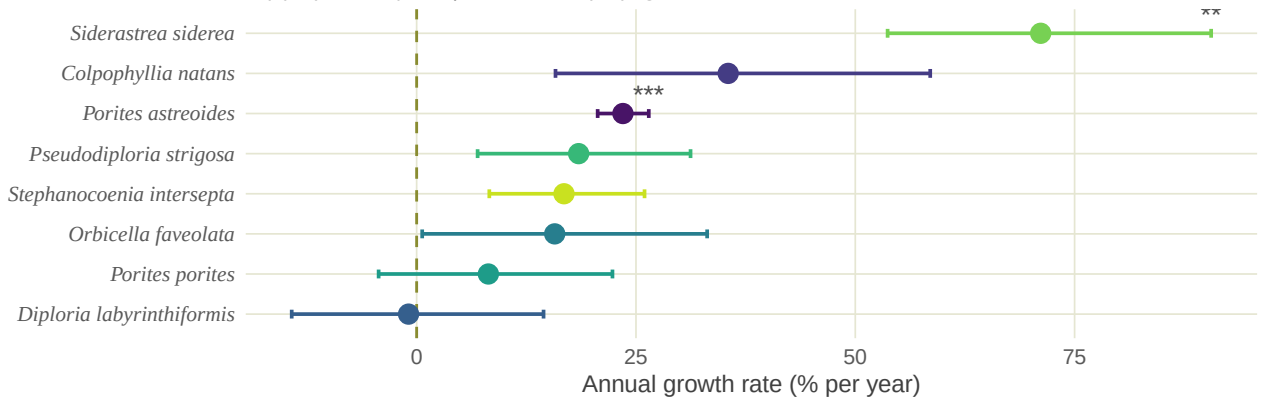

Line = LMM prediction at mean size | Points = observed mean $\pm$ SE

Colony area (cm²)

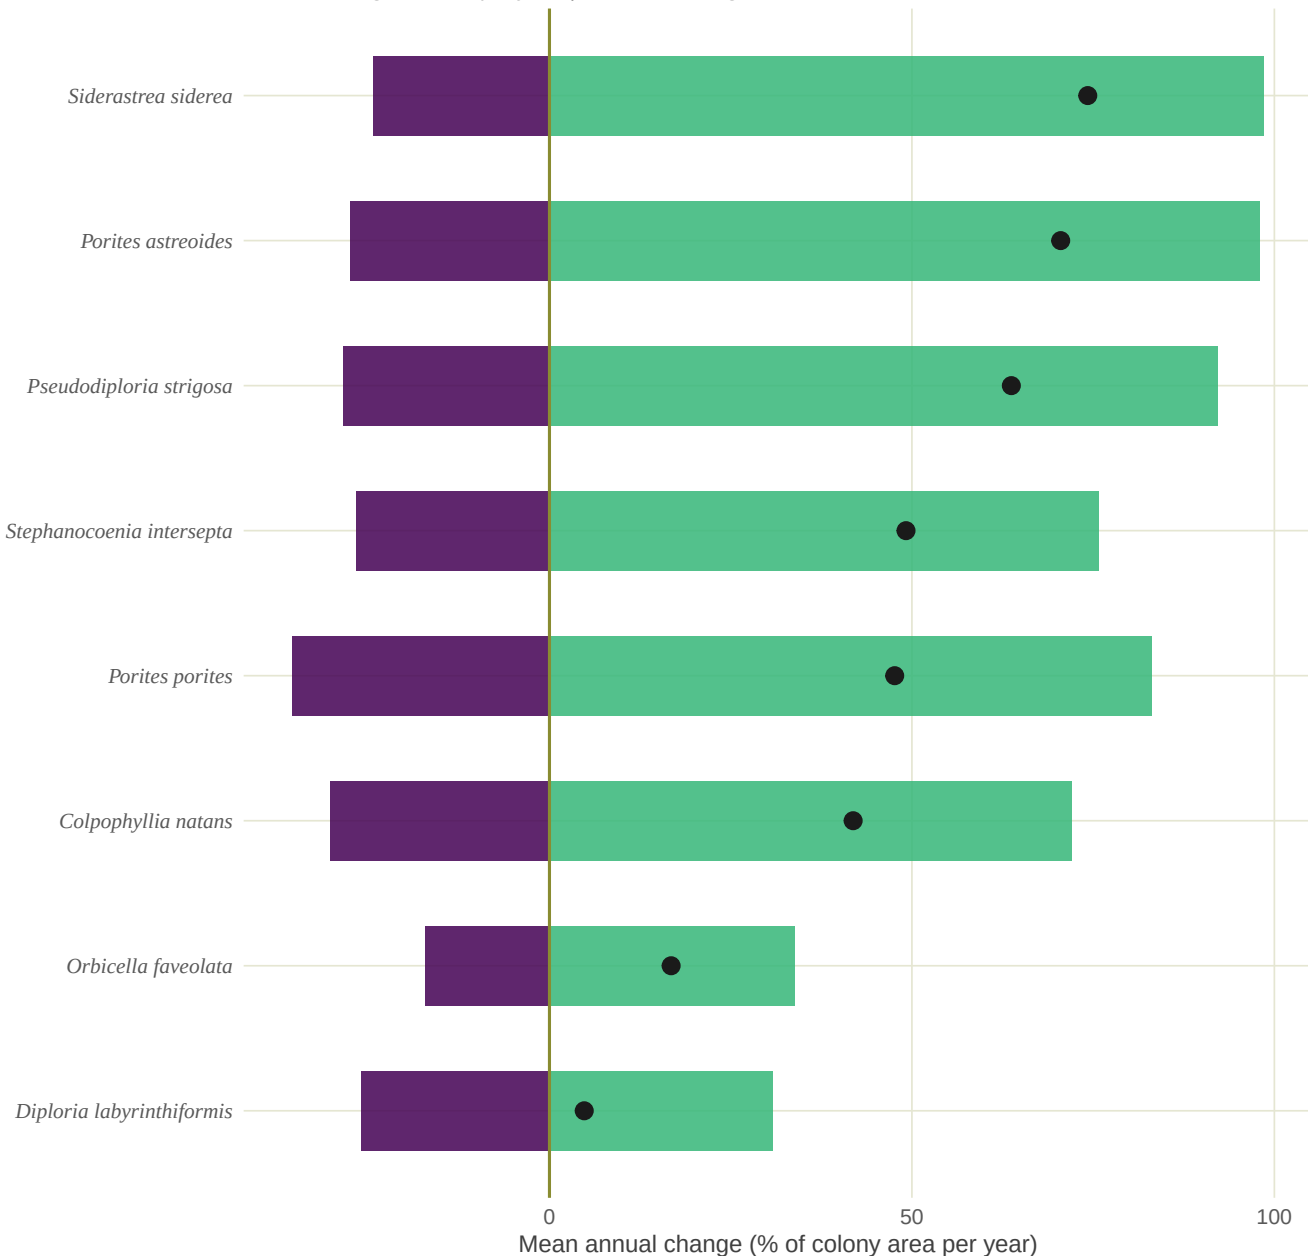

Per-species annual growth rate

$\exp(\text{slope} \times 365) - 1$ | Error bars = propagated SE

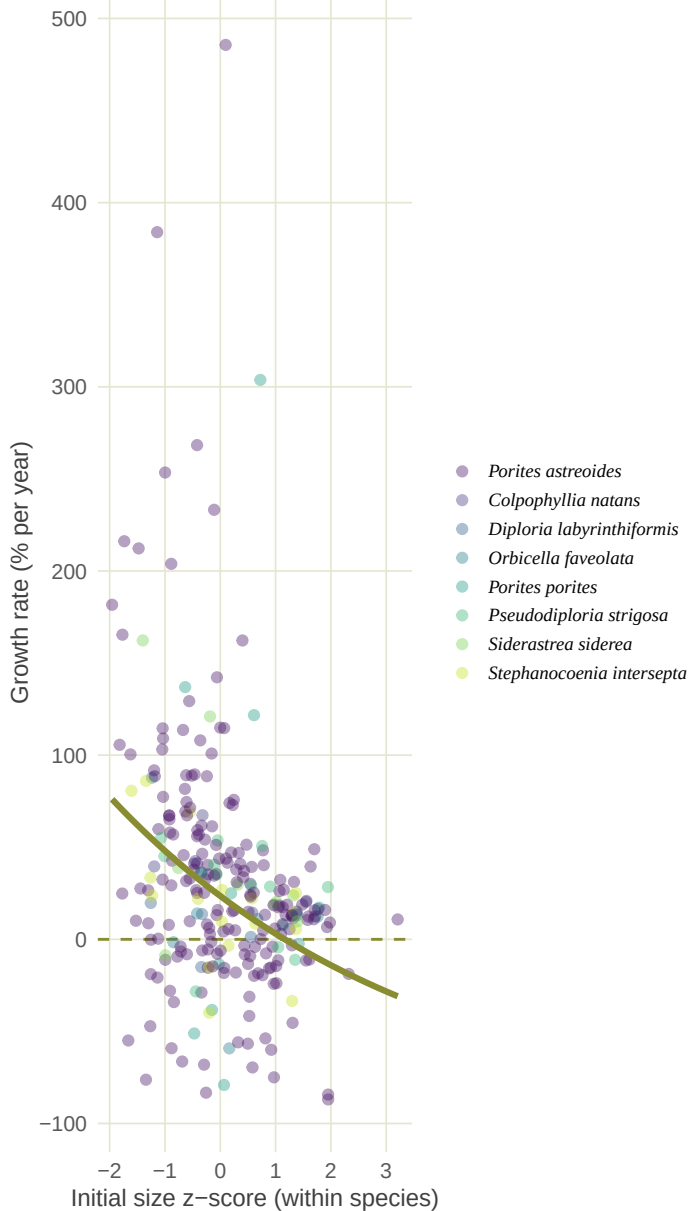

Growth vs. tissue loss balance per species

Bars = mean gained/lost per year | Dot = net change $\pm$ SE

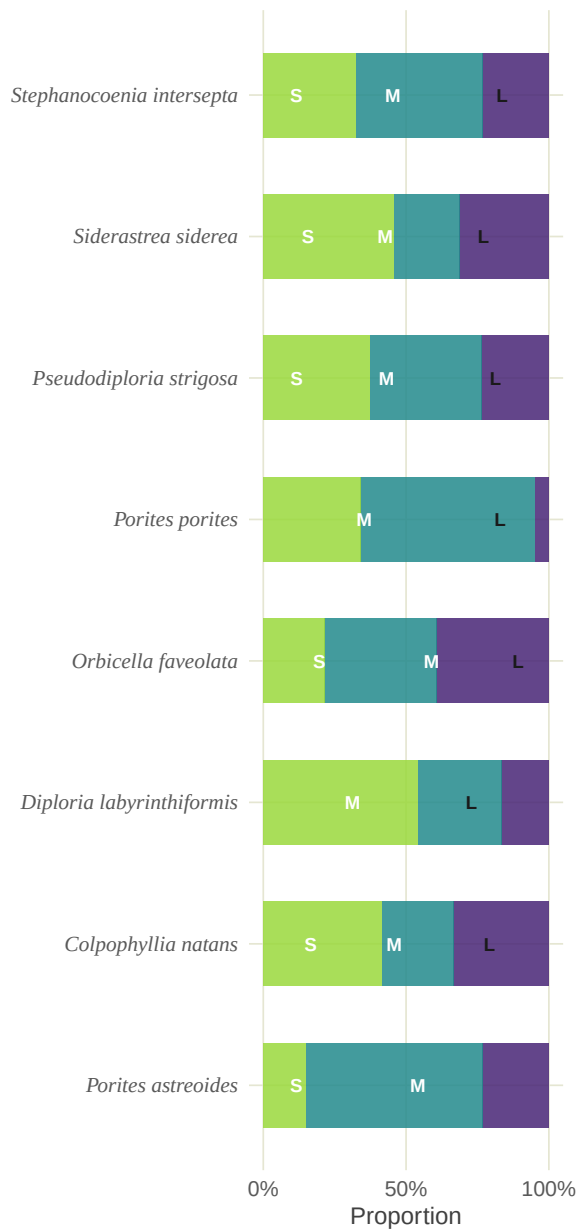

Colony size vs. growth rate

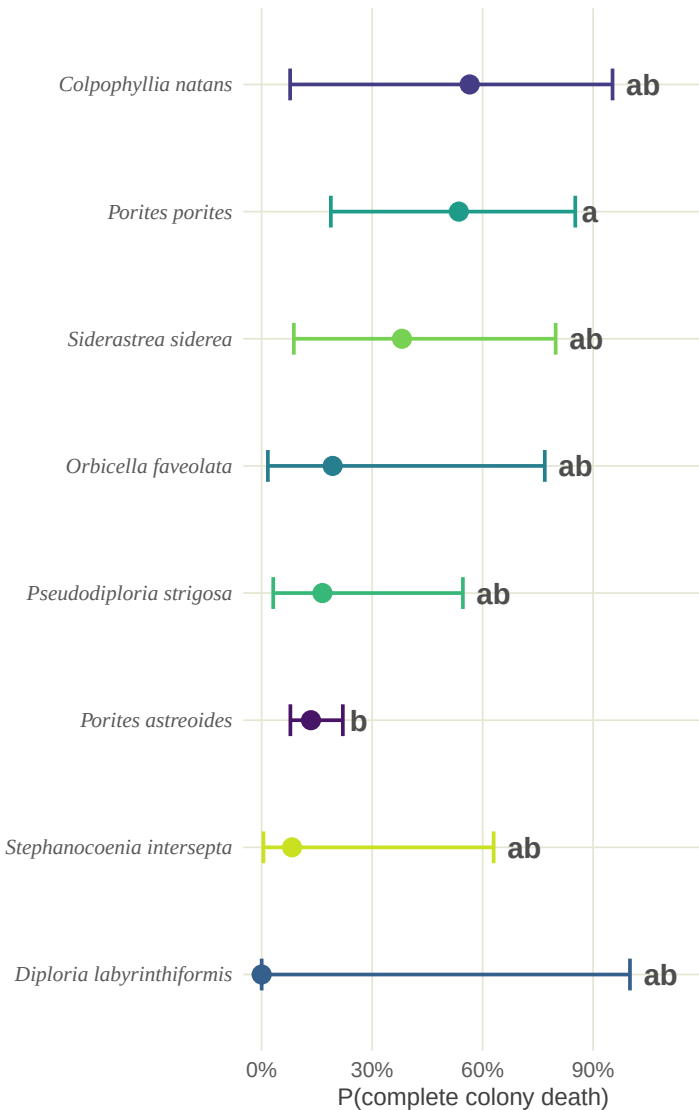

Larger initial colonies grow slower | Line = model (PAST)

Size distribution

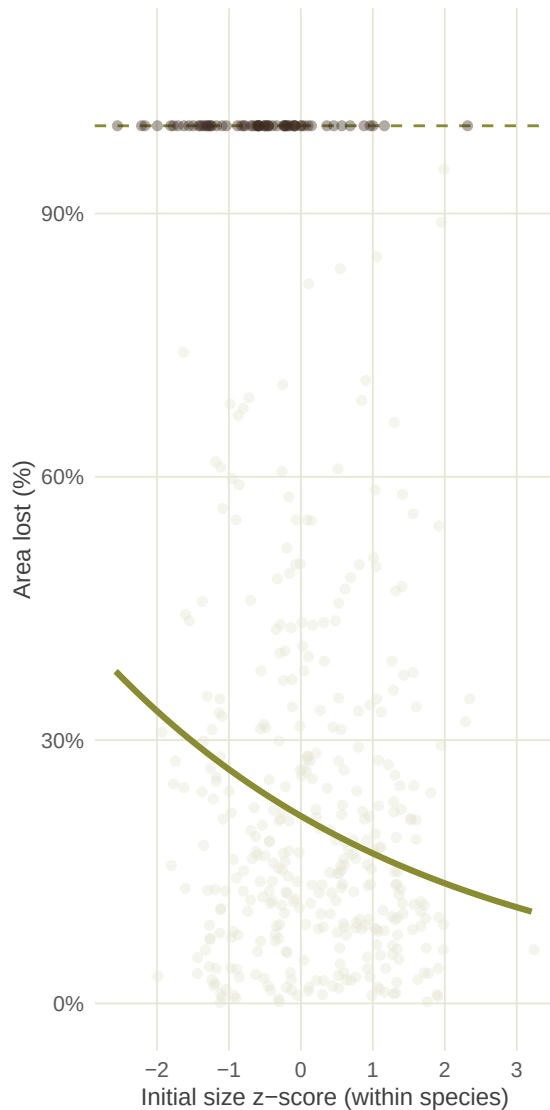

Colony mortality risk by species

Mortality severity by size

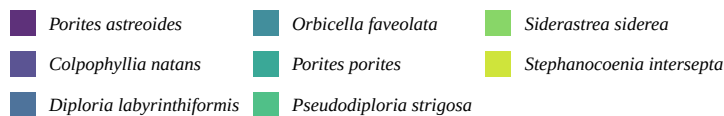

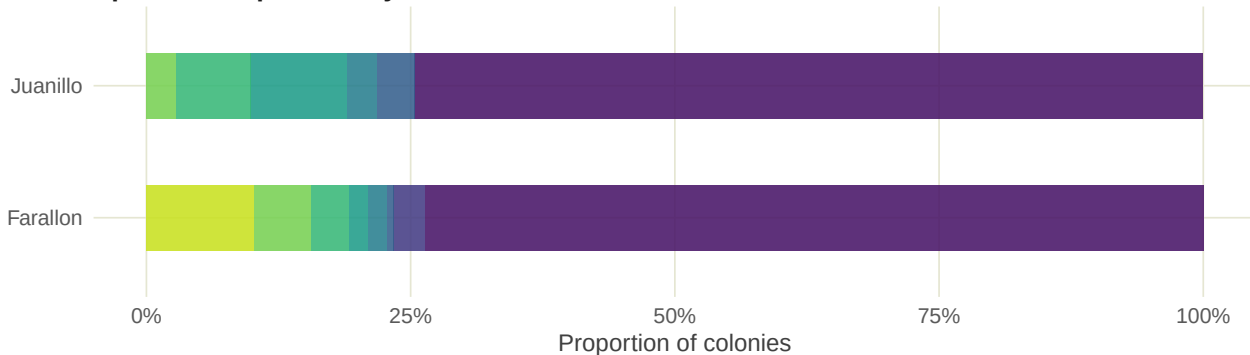

Line = LMM (PAST) | Dashed = 100% death

● Complete death (100%)

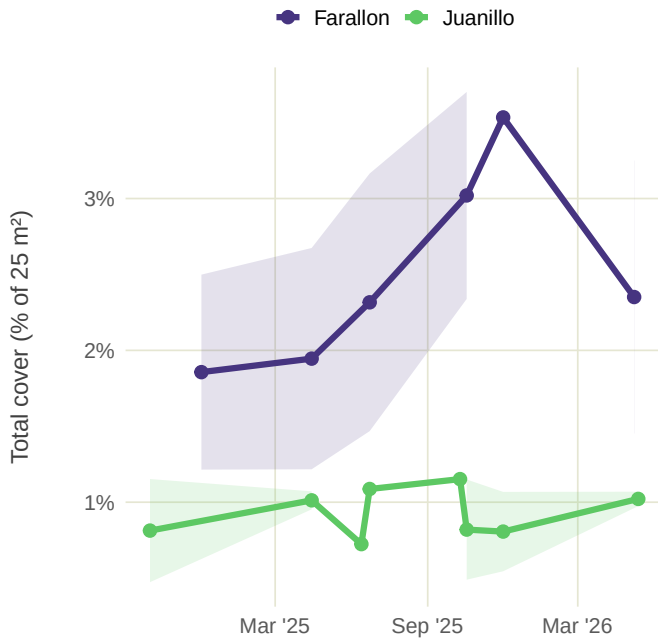

● Partial mortality

Species composition by site

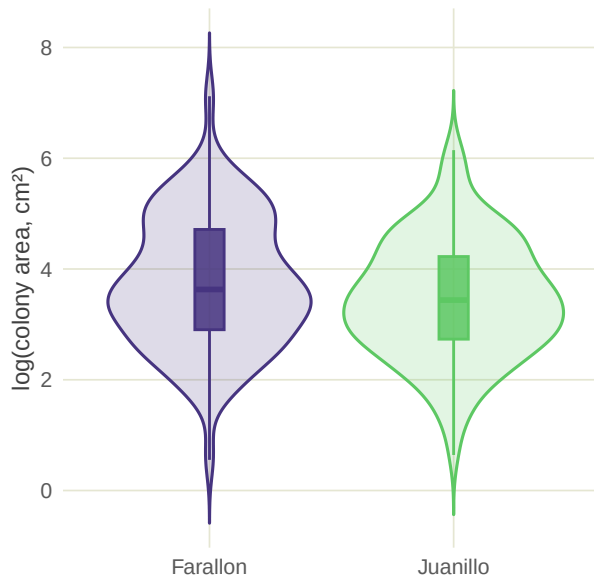

Total coral cover over time

Mean $\pm$ SE across plots

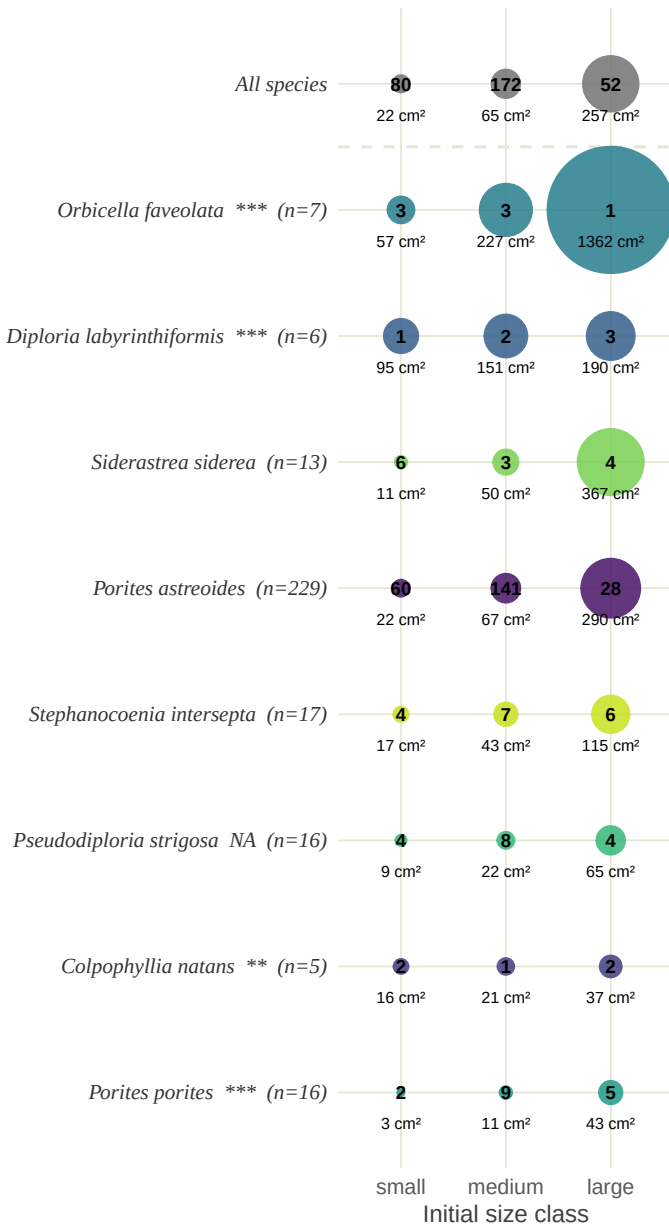

Initial colony size distribution

Colony area by species and size class

Circle labels: n colonies | Below: mean area

Pairwise species size comparison

Shared letter = not significantly different
